

# Value Chain Risk to Resilience

## Building climate resilience along value chains

### SDG ALIGNMENT

### Overview

Climate change poses severe risks to businesses and their suppliers, employees, customers, and communities along the value chain. Yet scientific information on physical climate impacts is largely unavailable in formats that companies can use in their business processes. The few companies that have conducted climate risk assessments have found it difficult or costly to act alone.

**Value Chain Risk to Resilience** is a business collaboration that aims to build climate resilience for communities, farmers and workers along value chains by:

- **Assessing climate risks** and integrating them into business processes
- **Developing standard approaches**, methodologies and metrics for business action on resilience
- **Taking action** and promoting collaboration among businesses

### Why Join?

- **Assess climate risks** along your value chains
- **Use output, outcome, and impact metrics** to measure climate resilience
- **Implement the TCFD recommendations** on governance and enterprise risk management
- **Develop programmatic work** to address climate risks with other companies
